and the articulation of the Indian economy into other blocks and the specification of demand and supply functions for exports and imports especially in terms of the disaggregation of the external trade block. The model also considers the scope for expansion and modernisation in the monetary sector, external trade, poverty and distribution. Separate blocks for sectoral outputs and prices, savings, public sector model capture important linkages among major sectors but also have specific total expenditure and poverty levels. Not only does the demand, government fiscal operations, money supply, prices, class structure, it can evaluate the key factors determining output. Model captures the main characteristics of the Indian economy poverty reduction within the modelling framework. Since the critical components such as income-expenditure distribution and on previous models, it has a sound theoretical base and adds to macro economic model for India. Although this model is based and demand. After this review the chapter includes a prototype appropriate level of economic activity that can reconcile supply and demand. Assumption of elastic supply, and the issue of determining the indicators such as an excessive reliance on Keynesian framework, the structure and functioning of the economy. They also have a clear regional theoretical framework and also remain more descriptive of the variables in their size, structure and sophistication. They lack in the mid-1980s and thereafter. The review suggests that because based on the Computable General Equilibrium approach developed in the late developed during the mid-1970s and the structural models
